

JOINT IMO/ITU EXPERTS GROUP ON MARITIME RADIOCOMMUNICATION MATTERS 16th meeting Agenda item 5 IMO/ITU EG 16/5/17 5 June 2020 ENGLISH ONLY

# MODERNIZATION OF THE GLOBAL MARITIME DISTRESS AND SAFETY SYSTEM (GMDSS)

Draft revision of COMSAR/Circ.33 on GMDSS Coast Station Operator's Certificate (CSOC) model course

## Submitted by France and ITF

#### **SUMMARY**

Executive This document presents a revision to COMSAR/Circ.33 on GMDSS

summary: Coast Station Operator's Certificate (CSOC) model course

Action to be taken: Paragraph 10

Related NCSR 4/29, annex 11; NCSR 7/23 and NCSR 7/WP5

documents:

#### Introduction

- The latest draft amendments to SOLAS chapter IV are in NCSR 7/WP.5, annex 1. In addition, consequential amendments to others instruments other than SOLAS should be finalized for approval by NCSR 8. The present document proposes a revision of COMSAR/Circ.33 on *GMDSS Coast Station Operator's Certificate (CSOC) model course*.
- 2 As agreed in the modernization plan of the GMDSS (NCSR 4/29, annex 11), it was identified that in addition to seafarer training, shore-based personnel training and operational requirements will be affected.

## **Background**

- 3 This circular is not a model course but a syllabus for a course. A model course is still expected, but this model course should be elaborated in a second step. In that respect, the word "model" in the title was confusing and was removed.
- The most important change regards the introduction of the term "Recognized mobile satellite service". The abbreviations RCC, CRS and CES are used as indicated in the

Page 2

IAMSAR Manual. Some editorials were made in order to have a clear text and to be comprehensive, like defining an abbreviation the first time it appears.

5 The sections in the syllabus are organized differently for a more logical and sequential delivery for trainees. The order of the main sections of the syllabus are now the following:

Section 1 - GMDSS overview

Section 2 - Radio wave characteristics and propagation

Section 3 - Types of station in the mobile service

Section 4 - Digital selective calling

Section 5 - RT communications

Section 6 - SATCOMS/Recognized mobile satellite service

Section 7 - NAVTEX services

Section 8 - EPIRBs

Section 9 - Emergency portable VHF radios

Section 10 - Devices for locating

Section 11 - Concept of RCC, CRS and CES operations

Section 12 - Implications of the GMDSS for RCCs

Section 13 - Practical use of RCC, CRS and CES communication equipment

Section 14 - Telephone, fax and RT calls to ships

- Section 8.6 "distress alerts" and section 8.8 "false alerts" are proposed to be included as new sections 12.1 and 12.2 because these items are of great implications for RCC and cover not only SATCOMS but all other radiocommunication systems. Section 8.9 is also proposed to be included into new section 12.9 covering databases.
- Section 8.7 is proposed to be moved into section 13 as it refers to the different SATCOMS broadcasting systems that an RCC can use (such as SARNet, FleetNet, other than the formal EGC system). With the above modification in the organization of the syllabus, section 8 should focus on the primary GMDSS functions and uses, and section 13 should be the place to enlarge the use of recognized mobile satellite services by RCC.
- 8 Last but not least, the use of the term "discuss" was not clear in class setting, thus it is replaced with "describe", "state" or "list" as deemed appropriate. Usage of the word "discuss" would create confusion over evaluation methods i.e. a group discussion evaluation.

#### **Proposal**

9 It is proposed that COMSAR/Circ.33 is revised as indicated in the annex.

## **Action requested of the Experts Group**

10 The Experts Group is invited to consider the proposal in paragraph 9, and take action as appropriate.

\*\*\*

## **DRAFT REVISION OF COMSAR/CIRC.33**

## GMDSS COAST STATION OPERATOR'S CERTIFICATE (CSOC) MODEL COURSE

- The Sub-Committee on Navigation, CRadiocommunications and Search and Rescue (NCSRCOMSAR), at its [...]eighth session (...16 to 20 February 2004), noted the amendments to the Safety Of Life At Sea (SOLAS) Convention adopted by the Maritime Safety Committee (MSC) at its [...] session (...) in Resolution MSC [...].
- The Sub-Committee reviewed finalized the GMDSS Coast Station Operator's Certificate (CSOC) course for Coast Station Operators to ensure that staff on duty in rescue coordination centres (RCC), coast radio stations (CRS) and in coast earth stations (CES) are adequately qualified and trained to operate the stations effectively in accordance with to the SOLAS Convention as amended.
- The Sub-Committee also agreed that this course should be made available as an IMO model course.
- The Sub-Committee further agreed that, pending validation and in view of an urgent need for immediate provision of training of CRS, CES coast station and RCC Operators, the course as set out in the annexes to the current circular, should be made available to Member Governments as soon as possible.
- Member Governments are invited to bring this circular to the attention of all parties concerned and use the course in the interim to train the CRS, CES coast station and RCC operators until the IMO model course has been finalized and validated.
- 6 This circular revokes COMSAR.1/Circ.33.

## GMDSS (CSOC) COURSE AIMS AND OBJECTIVES

#### 1 AIMS

- 1.1 The Global Maritime Distress and Safety System (GMDSS) course is designed to revise well known radio communication practices and to enhance procedures within Rescue Coordination Centre (RCC), and Coast Radio Station (CRS), and Coast Earth Station (CES) operations rooms.
- 1.2 It will raise awareness of GMDSS systems and procedures amongst RCC, and CRSoast Radio Station, and CES personnel, promote best practice and efficient use of radio communication equipment.
- 1.3 The course will aim to achieve standards common to those required of professional mariners (GMDSS General Operator's Certificate) and, as such, promote the certification of RCC, and CRS, and CESoast Radio Station personnel.

#### 2 **OBJECTIVES**

- 2.1 By the end of the course the participant will have revised all Routine, Distress, Urgency and Safety radiotelephony (RT) procedures to a common standard of expertise.
- 2.2 By the end of the course the participant will have a comprehensive knowledge of the GMDSS system, including all component parts and procedures.
- 2.3 By the end of the course the participant will have considered all the implications of the GMDSS for the search planner and how to apply the knowledge to real life situations.
- 2.4 By the end of the course the participant will have consolidated knowledge and expertise in the use of all RCC, and CRS, and CESoast Radio Station communication equipment.
- 2.5 By the end of the course the participant will have his/her knowledge and competence measured by a series of three examinations which be at least equivalent to the standards set by the GMDSS General Operator's Certificate.

## **SYLLABUS ITEMS**

## **SECTION 1 - GMDSS overview**

1.1	Origins and implementation
1.2	Objective, concept and functions of the GMDSS
1.3	Application
1.4	Sea areas defined
1.5	General equipment types

Equipment requirements by sea area

# **SECTION 24 - Radio wave characteristics and propagation**

2 <del>1</del> .1	Concept of radio frequency, wavelength and velocity
2 <del>1</del> .2	Relationship between wavelength and aerial height/length
2 <del>1</del> .3	Units of radio frequency and the frequency spectrum
2 <del>1</del> .4	Propagation mechanisms
2 <del>1</del> .5	Types of modulation
2 <del>1</del> .6	Classes of emission
2 <del>1</del> .7	Simplex & duplex

## SECTION 3 - Types of station in the mobile service

3.1	Maritime mobile service
3.2	Aeronautical mobile service
3.3	Land mobile service

## **SECTION 4 - Digital selective calling**

4.1	General overview
4.2	DSC frequencies
4.3	National DSC coast station arrangements
4.4	DSC action by ship and CRS
4.5	Overview of HF DSC

## **SECTION 5 - RT communications**

Distress
Urgency
Small craft safety information (SCSI) broadcasts where applicable
Safety
Routine communications and Radio regulations
RT communications integrity

## SECTION 6 - SATCOMS/Recognized mobile satellite service

6.1	General overview
6.2	Component parts of the system
6.3	Variety of communications
6.4	System equipment

## 6.5 Enhanced Group Call (EGC)

#### **SECTION 7 - NAVTEX services**

- 7.1 General overview
- 7.2 Ship equipment and message priorities
- 7.3 Message categories
- 7.4 National NAVTEX system

## **SECTION 8 - EPIRBs**

- 8.1 General overview
- 8.2 The COSPAS-SARSAT system
- 8.3 Approved EPIRBs and EPIRB databases

## **SECTION 9 - Emergency portable VHF radios**

- 9.1 General requirements
- 9.2 Mandatory channels

## SECTION 10 - Devices for locating

- 10.1 General overview
- 10.2 Positioning aboard ship
- 10.3 Technical specification
- 10.4 Range of signals for locating

## SECTION 112 - Concept of RCC, and CRS and CES oast Radio Station operations

- 112.1 Equipment types
- 112.2 Workstations
- 112.3 Log keeping
- 112.4 Publications
- 11.5 Codes, signals and standard phrases
- 11.6 communications for SAR operations
- 112.75 Authority and responsibility for national RCC, and CRS and CESoast Radio Station communication
- 112.86 Advice to the Public on efficient radio procedure and use of radio communication equipment
- 112.97 Equipment user manuals & guides
- 112.108 Equipment power delivery<del>Function, use and characteristics of back up power supplies for communication equipment</del>

#### **SECTION 3 - RT communications**

- 3.1 Distress
- 3.2 Urgency
- 3.3 Small craft safety information broadcasts (SCSI) where applicable
- 3.4 Safety
- 3.5 Routine communication and Radio regulations
- 3.6 RT communication integrity

## SECTION 4 - Types of station in the maritime mobile service

#### **SECTION 5 - GMDSS overview**

<b>5</b> 1	Origine a	nd implementat	ion
0. 1	<del>Ongino a</del>	<del>na mpiomontat</del>	$\overline{\mathbf{c}}$

- 5.2 Objective, concept and functions of the GMDSS
- 5.3 Application
- 5.4 Sea areas defined
- 5.5 General equipment types
- 5.6 Equipment requirements by sea area

## **SECTION 6 - EPIRBs**

- 6.1 General overview
- 6.2 The COSPAS-SARSAT system
- 6.3 Approved EPIRBs and EPIRB databases

#### **SECTION 7 - NAVTEX services**

- 7.1 General overview
- 7.2 Ship equipment and message priorities
- 7.3 Message categories
- 7.4 National NAVTEX system and broadcast procedure

## SECTION 8 - SATCOMS/Inmarsat

- 8.1 General overview
- 8.2 Component parts of the system
- 8.3 Variety of communications
- 8.4 System equipment
- 8.5 Enhanced Group calling
- 8.6 Distress alerts
- 8.7 SafetyNet, FleetNet, SARNet
- 8.8 False alerts
- 8.9 Databases

#### SECTION 9 - SART

- 9.1 General overview
- 9.2 Positioning aboard ship
- 9.3 Technical specification
- 9.4 Range of SART signals

## SECTION 10 - Emergency portable VHF radios

- 10.1 General requirements
- 10.2 Mandatory channels

## **SECTION 11 - Digital selective calling**

- 11.1 General overview
- 11.2 DSC frequencies in VHF, MF and HF bands
- 11.3 National DSC coast station arrangements
- 11.4 DSC action by ship and coast stations

## 11.5 Overview of HFDSC

## **SECTION 12 - Implications of the GMDSS for RCCs**

12.1 Distress aler	ts
--------------------	----

- 12.2 False alerts
- 12.3 Interference problems
- 12.44 Information gathering
- 12.52 Search planning
- 12.63 Effort allocation
- 12.74 Search instructions
- 12.85 Probability of detection (PoD)
- 12.96 Decoding MMSIs, serial numbers & alert messages, and databases

# SECTION 13 - Practical use of RCC, and CRS and CES east Station communication equipment

- 13.1 Communication equipment
- 13.2 Other types of SATCOMS message broadcast
- 13.3 Testing and maintenance of GMDSS equipment

## SECTION 14 - Telephone, fax and RT calls to ships

- 14.1 Methods of making calls
- 14.2 Methods of charging calls

#### SYLLABUS AIMS AND OBJECTIVES

NOTE: It is recommended that the syllabus objectives highlighted in bold italics may not be required if an individual has previously qualified in the GMDSS General Operator's Certificate.

#### **SECTION 1 - GMDSS OVERVIEW**

## 1.1 Origins and implementation

**Aim:** To ensure that participants gain a knowledge of how the GMDSS developed and an overview of previous legislation governing maritime communications.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory the organizations responsible for the administration of the GMDSS, both international and domestic;

State correctly from memory the international agreement which enables the GMDSS, and state correctly from memory the domestic legislation which has ratified the system within National legislation;

State correctly from memory, 3 out of 4 types of equipment on which communication legislation prior to the GMDSS was based; and

Discuss accurately from memory 4 relevant advantages of GMDSS communication regulations.

## 1.2 Objective, concept and functions of the GMDSS

Aim: To consider and discuss the concept, objectives and function of the GMDSS system.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory two out of three main objectives desired of the GMDSS system; and

List correctly, with the aid of a mnemonic if necessary, all 9 functions of the GMDSS.

## 1.3 Application

**Aim:** To consider what vessels must comply with GMDSS regulations and what provision there is for exemption from compliance.

**Objectives:** By the end of the session the participant will be able to:

Decide correctly from memory on every occasion, given the size, type, nature of passage and means of propulsion of any vessel, whether that vessel must comply with GMDSS legislation or not; and

List correctly from memory 3 out of 6 official exemptions from GMDSS legislation.

#### 1.4 Sea areas defined

**Aim:** To examine the designation of sea areas as laid down in GMDSS legislation compared both to the world's coastline and to the declarations of particular Governments.

**Objectives:** By the end of the session the participant will be able to:

Define correctly on every occasion from memory the 4 sea area designations under GMDSS regulations;

Decide correctly on every occasion from memory which GMDSS sea area a position would relate to:

State correctly from memory how to validate the answers above in terms of declarations by a particular Government; and

State correctly from memory, which sea area(s) are within own SRR.

## 1.5 General equipment types

**Aim:** To develop an overview of the types of ships equipment and communication systems which make up the GMDSS.

**Objective:** By the end of the session the participant will be able to list from memory 9 systems of communication equipment which contribute to the GMDSS system.

## 1.6 Equipment requirements by sea area

**Aim:** To develop an understanding of the GMDSS requirements for ships equipment dependeant upon sea area of navigation.

**Objective:** By the end of the session the participant will be able to:

Correctly list from memory all [8] types of communication equipment which must be carried by a ship navigating exclusively in GMDSS sea area A1;

Correctly list from memory all equipment, in addition to those for sea area A1, which must be carried by a ship navigating in sea area A2;

Correctly list from memory all equipment, in addition to those for sea areas A1 and A2, which must be carried by a ship navigating sea area A3; and

Correctly list from memory all equipment, in addition to those for sea areas A1, A2 and A3, which must be carried by a ship navigating sea area A4.

#### SECTION 21 - RADIO WAVE CHARACTERISTICS AND PROPAGATION

### 24.1 Concept of radio frequency, wavelength and velocity

**Aims:** To explore the basic physical science which underpins the theory of radio waves and propagation.

**Objectives:** By the end of the session the participant will be able to:

Discuss accurately with the aid of a handout, the concepts of radio wavelength, frequency and velocity; and

State correctly from memory the relationship between radio wavelength, frequency and velocity.

## 24.2 Relationship between wavelength and aerial height/length

**Aims:** To give the participant a basic rule of thumb in understanding how the wavelength of radio signals affects the optimum length of aerial.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory a rule of thumb calculation which can determine the optimum length of antenna required for a given radio wavelength.

## 24.3 Units of radio frequency and the frequency spectrum

**Aims:** To introduce the participant to the International System of Units (SI units) used to measure radio frequency, wavelength and velocity and the correct means of labelling such values.

**Objectives:** By the end of the session the participant will be able to:

Quote correctly from memory the SI units used to measure velocity, frequency and wavelength;

State correctly from memory the 3 standard multiples of the basic unit of frequency and the correct labelling for each;

State correctly from memory on every occasion, which part of the frequency spectrum a given radio frequency lies;

State correctly from memory the exact frequency band appropriate to VHF maritime radio communications; and

Discuss accurately with the aid of a handout a practical use for each of the radio bands.

## 24.4 Propagation mechanisms

Aims: To examine the means by which radio waves travel in still air.

**Objectives:** By the end of the session the participant will be able to:

Discuss accurately with the aid of a handout the physical form of radio waves;

List correctly from memory, three3 ways in which radio waves are affected by the atmosphere;

Discuss accurately with the aid of a handout, the 3 layers of atmosphere which affect radio wave propagation:

List correctly from memory the 4 types of radio propagation wave and be able to discuss accurately from memory characteristics of each;

State correctly with the aid of a handout, what the meaning of terms skip zone and skip distance mean;

Discuss accurately with the aid of a handout, the meaning of the term "fading" of radio reception;

State correctly from memory how to calculate the theoretical radio horizon for any particular antenna;

List correctly from memory 3 properties which will affect the propagation of radio waves over a long distance; and

Discuss accurately from memory 3 properties which will affect the propagation of VHF radio waves.

## 24.5 Types of modulation

**Aims:** To introduce the participant to the concepts of amplitude and frequency modulation, carrier and bandwidth.

**Objectives:** By the end of the session the participant will be able to:

Discuss accurately from memory the meaning of the term modulation;

State correctly from memory the two2 main forms of modulation used in RT communications and state correctly which applies to VHF radio and which to MF radio;

Discuss accurately with the aid of a handout, the characteristics of amplitude modulation:

Discuss accurately with the aid of a handout, the characteristics of frequency modulation; and

Discuss accurately with the aid of a handout, the terms bandwidth and carrier frequency.

#### 21.6 Classes of emission

**Aims:** To introduce the participant to the ITU classifications of emission and examine those of particular relevance to maritime RT communications.

**Objectives:** By the end of the session the participant will be able to:

Discuss accurately with the aid of a handout, the method of designating class of emission used by the ITU;

State correctly from memory the three3 letter acronym designating the class of emission used with 2182 kHz distress communication channel and discuss the meaning accurately from memory the meaning;

State correctly from memory the three3 letter acronym designating the class of emission for use with MF band working frequencies and discuss the meaning accurately from memory the meaning; and

State correctly from memory the three3 letter acronym designating the class of emission for use in VHF RT communications and discuss the meaning accurately from memory the meaning.

## 24.7 Simplex & duplex

**Aims:** To introduce the participant to the basic concept of simplex and duplex RT communications.

**Objectives:** By the end of the session the participant will be able to:

Discuss accurately from memory the characteristics of simplex communications; and Discuss accurately from memory the characteristics of duplex communications.

## SECTION 3 - Types of station in the maritime mobile service

#### 3.1 Maritime mobile service

**Aims:** To determine working definitions for different types of operating station within the maritime communication system.

**Objectives:** By the end of the session the participants will be able to:

Define accurately from memory the terms: station, ship and traffic as they are applied to maritime communications;

List correctly from memory 5 out of 6 stations with which a ship is permitted to communicate directly by radiotelephonyRT;

List correctly from memory two facilities provided by a CRS; and

List correctly with the aid of a handout, the 3 methods by which a vessel can achieve commercial communications via a CRS.

### 3.2 Aeronautical mobile service

**Aims:** To determine working definitions for different types of operating station within the aeronautical communication system.

**Objectives:** By the end of the session the participants will be able to:

Understand the different frequency bands used for aircraft;

Define accurately from memory frequencies for communication with aircraft on VHF, MF and HF bands; and

Identify and use Aircraft's Call signs in Search And Rescue (SAR) operations.

## 3.3 Land mobile service

**Aims:** To determine working definitions for different types of operating station within the land communication system.

**Objectives:** By the end of the session the participants will be able to:

Understand the different frequency bands and systems used for land mobile service; and

Define accurately from memory frequencies and systems for communication with land mobiles.

#### **SECTION 4 - DIGITAL SELECTIVE CALLING**

#### 4.1 General overview

**Aims:** To explore fully the characteristics and principles of the Digital Selective Calling (DSC) system.

**Objectives:** By the end of the session the participant will be able to:

List correctly from memory, in which sea areas DSC is relevant;

Describe accurately with the aid of a handout, basic technical details of the DSC system, including the duration of a DSC alert on MF and VHF;

State accurately from memory, the term used to describe the error check function of the DSC system and with the aid of a handout discuss how this works;

Describe accurately from memory, the number and frequency of distress alerts transmitted by ships' equipment;

State correctly from memory, the options available when addressing a DSC message;

Discuss accurately from memory, a potential difficulty in terms of range of communications when operating DSC equipment and the subsequent analogue RT equipment;

Discuss accurately from memory the meaning of the terms designated and undesignated DSC distress alerts;

Demonstrate from memory, correct analysis of a DSC distress alert message on 15 out of 18 occasions:

Discuss accurately from memory, how position information can be derived for DSC systems, and the implications this may have for search area determination;

Distinguish accurately from memory distinguish, on every occasion, between MMSI numbers for ship stations, shore stations and groups of ship stations; and

State correctly from memory, the 3 sources of information to enable the decoding of MMSI's.

#### 4.2 DSC frequencies

**Aims:** To determine the frequencies in use with the VHF, HF and MF DSC system, and the procedure for subsequent RT communications.

**Objectives:** By the end of the session the participant will be able to:

List accurately from memory, the frequency of MF DSC, the channel appropriate for VHF DSC, and in each case the associated RT frequency and channel; and

List accurately with the aid of a handout, the 5 frequencies of HF DSC and in each case the associated RT frequencies.

## 4.3 National DSC coast stations arrangements

Aims: To examine the configuration of DSC coast stations in the national SRR.

**Objectives:** By the end of the session the participant will be able to:

List correctly from memory, the RCC and CRS in the SRR which are provided with MF DSC.

## 4.4 DSC action by ship and CRS

**Aims:** To explore in greatest possible depth the procedure laid down for operation of the DSC system.

**Objectives:** By the end of the session the participant will be able to:

Discuss accurately from memory, when a RCC should acknowledge a Distress alert from a vessel at sea under varying circumstances:

- 1. Position is in the RCC SRR;
- Position is outside the RCC SRR;
- 3. No position information is shown on alert;

Discuss accurately from memory, the subsequent action required of a CRS having acknowledged a DSC distress alert;

State correctly from memory, under what circumstances a DSC distress alert would be acknowledged by a ship station;

State correctly from memory, under what circumstances a DSC distress relay would be transmitted by a ship station;

State correctly from memory, under what circumstances a DSC distress relay would normally be transmitted by a CRS;

Discuss accurately from memory, the circumstances under which a DSC distress relay would be transmitted by a CRS;

State correctly from memory, what action is required by a CRS receiving a distress relay from another CRS;

State accurately from memory, what action is required by a CRS receiving a distress acknowledgement from another CRS;

State accurately from memory, what action is required by a CRS in receipt of a distress relay from a ship station; and

State correctly from memory, under what circumstances a DSC acknowledgement is required from a CRS when dealing with urgency, safety and routine alerts.

#### 4.5 Overview of HF DSC

**Aims:** To ensure that participants are aware of the HF DSC system, the areas it applies to and which countries are directly involved.

**Objectives:** By the end of the session the participant will be able to:

Discuss accurately from memory, the areas of the globe where HF radio can achieve propagation;

State correctly from memory, how HF DSC and associated procedure compares to that of MF DSC:

State correctly from memory, where HF DSC coast radio stations are situated; and

State correctly from memory, the message routing procedure from HF DSC coast radio stations to the appropriate RCC for SAR action.

#### SECTION 2 - CONCEPT OF RCC AND COAST RADIO STATION OPERATIONS

## 2.1 Equipment types

Aim: To introduce participants to the types of communication equipment operated by the Rescue Centre or Coast Radio Station in which they operate.

**Objective:** By the end of the session participants will be able to correctly name from memory all types of RCC or Coast Radio Station radio communication equipment used in operation rooms.

#### 2.2 Workstations

Aim: To raise the awareness of participants as to the correct procedure of handing over a VHF channel 16 watch and associated equipment checks to make.

**Objective:** By the end of the session participants will be able to list correctly from memory all key considerations in terms of continuity of watch keeping and equipment checks for the operators attention when taking over the VHF channel 16 watch from a colleague.

## 2.3 Log keeping

Aim: To ensure all participants understand and are in a position to apply the correct log keeping procedure at radio watch keeping workstations.

**Objective:** By the end of the session the participant will be able to discuss accurately from memory, all key considerations and log entries when maintaining a radio log.

#### 2.4 Publications

Aim: To raise the awareness of participants to written procedural support material held as standard issue at Rescue Centres.

Objectives: By the end of the session participants will be able to:

List correctly from memory 5 publications held as standard issue at Rescue Centres; and

State accurately from memory on 7 out of 10 occasions, in which publication to find particular details relating to maritime communications.

# 2.5 Authority and responsibility for national Rescue Centres and Coast Radio Station communications

**Aim:** To ensure participants understand levels of authority and responsibility involved in operating Rescue Centre and Coast Radio Station communication equipment and the responsibility for local training and development.

Objectives: By the end of the session participants will be able to:

Discuss accurately from memory by whose authority Rescue Centre and Coast Radio Station communication equipment is operated;

Discuss accurately and from memory who is responsible for correct operation and use of Rescue Centre and Coast Radio Station communication equipment; and

Discuss accurately and from memory who is responsible for ensuring the provision of adequate training for individuals in the operation and use of Rescue Centre and Coast Radio Station communication equipment.

# 2.6 National policy to advise the public on radio procedure and effective use of equipment (if any)

Aims: To raise awareness amongst participants as to National Rescue Centre or Coast Radio Station policy on giving advice to members of the public regarding the installation and operation of communication equipment.

Objectives: By the end of the session participants will be able to

State correctly from memory where to find details of official advice as to GMDSS equipment carriage recommendations for pleasure craft;

State correctly from memory where to find details of official advice as to GMDSS equipment carriage regulations and recommendations for fishing vessels;

Discuss accurately from memory the significance of the 1998 IMO resolution regarding equipment installations on ALL vessels by 1/2/05; and

List accurately from memory 5 reasons why mobile telephone equipment is not the preferred choice for communications equipment at sea.

## 2.7 Equipment user manuals & guides

Aims: To remind participants of the importance of maintaining user manuals and guides in good condition and their shared availability between all members of operations room staff.

Objectives: By the end of the session the participant will be able to:

Identify accurately, with the aid of student notes, all user manuals available to support equipment currently installed at Rescue Centres; and

State from memory where these manuals are located, or make a verbal report as to how he/she would arrange for these manuals to be stored and made available to all staff.

#### 2.8 Equipment power delivery

Aims: To raise the awareness of participants of his/her stations provisions for backup power supplies and standby batteries.

Objectives: By the end of the session the participant will be able to:

Describe accurately, with the aid of study notes, the provision for UPS and standby generator or battery power at his/her site.

### **SECTION 53 - RT COMMUNICATIONS**

#### 53.1 Distress

**Aims:** To revise correct radio procedure for all communications relating to Distress situations.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory, under what circumstances a vessel is permitted to use the distress call;

State correctly from memory, the meaning of the terms distress signal, distress call and distress message;

Demonstrate from memory, complete and accurate understanding of the correct format and content of a standard distress message;

Demonstrate from memory, accurate understanding of the correct format for a distress acknowledgement;

Discuss accurately from memory, an effective choice of timing for a distress acknowledgement in two situations of varying gravity and urgency;

Demonstrate from memory, complete and accurate understanding of the correct format and content of a distress relay message, given different sets of circumstances – Distress by RT;

State correctly from memory, 2 formats permitted for position information in a distress relay message;

Discuss accurately from memory, when the prowords seelonce distress and seelonce mayday would be used;

Discuss accurately from memory, the correct procedure for terminating a distress situation;

Discuss accurately from memory, the correct procedure for lifting silence, but retaining restricted working on an RT frequency;

State the correct proword which should precede every communication related to a distress incident.

## 53.2 Urgency

**Aims:** To enable the participant to revise RT communications procedure relevant to urgency situations.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory, the circumstances in which a vessel is permitted to use the urgency signal;

State correctly from memory, the meaning of the terms urgency signal, urgency call and urgency message;

Demonstrate from memory, an accurate knowledge of the correct format for a standard urgency message from a vessel;

Demonstrate from memory, an accurate knowledge of the correct format for an urgency acknowledgement message:

Demonstrate from memory, an accurate knowledge of the correct format for a standard urgency relay broadcast;

State correctly from memory, when an urgency broadcast for a red flare report will normally become a distress relay;

State correctly from memory, the type of message you would expect to receive from a vessel which has sighted a red flare from an unknown source; and

State correctly from memory, the type of broadcast which would be made for a medical situation on board ship.

## 53.3 Small craft safety information (SCSI) broadcasts (SCSI) where applicable

**Aims:** To revise the format and procedure relevant to the uncertainty phase of SAR operations.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory, the meaning of the term uncertainty phase and the associated key word(s);

Demonstrate correctly from memory, how the SCSI broadcast should be announced;

Demonstrate correctly from memory, a professional and efficient format for the SCSI broadcast:

State correctly from memory, the frequencies/channels which should be used to announce and broadcast a SCSI broadcast;

State correctly from memory, how a SCSI broadcast is repeated;

State correctly from memory, what action should be considered having broadcast a SCSI twice, but no positive information is forthcoming; and

Demonstrate accurately from memory, how a SCSI broadcast should be cancelled.

#### 53.4 Safety

**Aims:** To revise the format and procedure relevant to safety communications and broadcasts.

**Objectives:** By the end of the session the participants will be able to:

State correctly from memory, the meaning of the term safety signal;

State correctly from memory, what is the correct usage of the safety signal and message;

State correctly from memory, in what circumstances RCCescue Centres should make a local navigation warning;

State correctly from memory, under what circumstances broadcasts warning of drifting hazards should be repeated;

State correctly from memory, the frequency with which warnings relating to navigation buoys off station should be repeated;

State correctly from memory, the frequency with which warnings relating to defective or extinguished navigation lights should be repeated;

State correctly from memory, what frequencies and medium should be used for safety broadcasts, both in terms of RT, satellite and DSC communications; and

Demonstrate from memory, a satisfactory format for safety broadcasts which closely resembles those for distress and urgency situations and which indicates an efficient and professional approach.

## 53.5 Routine communications and Radio regulations

**Aims:** To revise well established National and ITU routine radio procedure and clarify some of the more important basic international radio regulations.

**Objectives:** By the end of the session the participant will be able to:

Describe accurately from memory and demonstrate competent use of the Rhythm-Speed-Volume-Pitch (RSVP) principles during RT communications;

Demonstrate from memory, the use of 10 out of 15 commonly used prowords, in the correct format and context;

State correctly from memory, the maximum length of an RT transmission on the distress frequencies;

State correctly from memory, the maximum length of an RT test transmission on the distress frequencies and state correctly from memory 1 item of information which must be included in this transmission:

Describe accurately from memory, the full call, abbreviated call and call serving as address, procedures as they apply to RT transmissions;

List correctly and be able to describe accurately from memory, 4 responses to a radio check which indicates the signal strength;

List correctly and be able to describe accurately from memory, 4 responses to a radio check which indicates the readability of the modulated signal;

State correctly from memory, the appropriate time zone used to identify all radio transmissions and log entries;

State correctly from memory, what frequencies vessels must monitor continuously after full implementation of the in GMDSS in 1999;

Describe accurately from memory, the regulations which direct vessels VHF radio distress watchkeeping;

Describe accurately from memory, the procedure to be adopted when a calling station has difficulty in raising another station;

State correctly from memory, who is designated as the controlling station during communications between a ship and shore station;

Describe accurately from memory, the action to be taken when station hears a call, but is not certain that the call was intended for it;

Discuss accurately from memory, the content of Radio regulations in respect of radio secrecy;

Discuss accurately with the aid of study notes, guidelines designed to help avoid radio interference;

Discuss accurately with the aid of study notes, guidelines designed to regulate preliminary radio operations;

List correctly from memory, the VHF channels RCCescue Centres and CRSoast Radio Stations are licensed to operate; and

List correctly with the aid of a handout, the MF frequencies RCCescue Centres and CRSeast Radio Stations are licensed to operate.

## 53.6 RT communications integrity

**Aim:** To revise the role of RCCescue Centres, and CRSoast Radio Stations and CES in policing the integrity of distress and working frequencies of RT communications where appropriate.

**Objectives:** By the end of the session the participant will be able to:

Discuss accurately from memory, the responsibility of RCCescue Centre, or CRSoast Radio Station or CES in relation to misuse of RT radio frequencies;

Discuss accurately from memory, the RCCescue Centre, or CRSoast Radio Station or CES guidelines as to when action should be taken against a rogue RT station;

State correctly from memory, where guidelines as to appropriate warning messages to stations misusing RT can be located, and where you would find the appropriate report form should further action be required.

#### SECTION 6 - SATCOMS / RECOGNIZED MOBILE SATELLITE SERVICES

## 6.1 General overview

**Aims:** To investigate the background and characteristics of the different Recognized mobile satellite services.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory, how many satellites are involved in the different Recognized mobile satellite services;

State correctly from memory, the orbit characteristics of different satellites of Recognized mobile satellite services and how they differ from those of the COSPAS-SARSAT system;

With the aid of a handout, discuss briefly but accurately the history of the different Recognized mobile satellite services;

List correctly from memory, the different recognized mobile satellite service areas for operations, and state correctly from memory which areas are applicable to your SRR;

State correctly from memory, what the nominal coverage of the different Recognized mobile satellite services are, as designated under the GMDSS, and state correctly from memory the coverage which has been achieved in practice; and

With the aid of a handout, list correctly the radio frequencies utilised by the different Recognized mobile satellite services, and with the aid of a handout, state correctly the purpose of each frequency.

## 6.2 Component parts of the system

**Aims:** To examine the component parts of the different Recognized mobile satellite services data routing system, and the role played by each part.

**Objectives:** By the end of the session the participant will be able to:

List correctly from memory, the contributing parts of the different Recognized mobile satellite services data routing system;

State correctly from memory, the meaning of the acronyms;

State accurately from memory, the concept for provision of CES/LES throughout the world in terms of the operating authority;

State correctly from memory, the location of different Recognized mobile satellite services Headquarters; and

State accurately from memory, the role of the key components of different Recognized mobile satellite services.

## 6.3 Variety of communications

**Aims:** To discuss the types of communication method and types of message which can be processed using the different Recognized mobile satellite services.

**Objectives:** By the end of the session the participant will be able to:

List correctly from memory, the different types of communication method provided for by each Recognized mobile satellite service; and

List correctly from memory, 4 categories of message which can be processed using each Recognized mobile satellite service.

### 6.4 System equipment

**Aims:** To examine the various standards of equipment available now and proposed for the future by mobile satellite services. Such examination will categorize each system as GMDSS acceptable or not and which types of communications are achievable through each system.

**Objectives:** By the end of the session the participant will be able to:

List correctly from memory, the different standards of equipment, including those currently in use and those planned for the future;

Distinguish correctly from memory, between the two acronyms ADE and BDE;

List correctly from memory, all 3 types of communications available through Inmarsat – C:

List correctly with the aid of a handout, all the types of communications available through different Recognized mobile satellite services; and

State correctly from memory, how distress messages can be processed using different Recognized mobile satellite service SES.

## 6.5 Enhanced Group Call (EGC)

**Aims:** To examine the purpose and usage of the different Recognized mobile satellite services EGC system.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory, the correct meaning of the acronym EGC;

State accurately from memory, the concept of the EGC system;

State correctly from memory, the different sub systems which operate within the EGC system:

List correctly from memory, all [5] types of message handled by EGC;

List correctly from memory, all [7] ways of addressing an EGC message; and

State correctly with reference to a handout, the meaning of the term "information provider" where necessary.

#### SECTION 4 - TYPES OF STATION IN THE MARITIME MOBILE SERVICE

Aims: To determine working definitions for different types of operating station within the maritime communication system.

Objectives: By the end of the session the participants will be able to:

Define accurately from memory the terms: station, ship and traffic as they are applied to maritime communications;

List correctly from memory 5 out of 6 stations with which a ship is permitted to communicate directly by radio telephone;

List correctly from memory two facilities provided by a coast station; and

List correctly with the aid of a handout, the 3 methods by which a vessel can achieve commercial communications via a Coast Station.

## **SECTION 5 - GMDSS OVERVIEW**

## 5.1 Origins and implementation

Aim: To ensure that participants gain a knowledge of how the GMDSS developed and an overview of previous legislation governing maritime communications.

Objectives: By the end of the session the participant will be able to:

State correctly from memory the organizations responsible for the administration of the GMDSS, both international and domestic;

State correctly from memory the international agreement which enables the GMDSS, and state correctly from memory the domestic legislation which has ratified the system within National legislation;

State correctly from memory, 3 out of 4 types of equipment on which communication legislation prior to the GMDSS was based: and

Discuss accurately from memory 4 relevant advantages of GMDSS communication regulations.

## 5.2 Objective, concept and functions of the GMDSS

Aim: To consider and discuss the concept, objectives and function of the GMDSS system.

Objectives: By the end of the session the participant will be able to:

State correctly from memory two out of three main objectives desired of the GMDSS system; and

List correctly, with the aid of a mnemonic if necessary, all 9 functions of the GMDSS.

## 5.3 Application

Aim: To consider what vessels must comply with GMDSS regulations and what provision there is for exemption from compliance.

Objectives: By the end of the session the participant will be able to:

Decide correctly from memory on every occasion, given the size, type, nature of passage and means of propulsion of any vessel, whether that vessel must comply with GMDSS legislation or not;

List correctly from memory 3 out of 6 official exemptions from GMDSS legislation; and Discuss accurately from memory the significance of a) 1/2/99 and b) 1/2/05 to the GMDSS master plan.

#### 5.4 Sea areas defined

Aim: To examine the designation of sea areas as laid down in GMDSS legislation compared both to the world's coastline and to the declarations of particular Governments.

Objectives: By the end of the session the participant will be able to:

Define correctly on every occasion from memory the 4 sea area designations under GMDSS regulations;

Decide correctly on every occasion from memory, given the lat & long of a position and/or (as appropriate), the distance from the shore, which GMDSS sea area a position would relate to:

State correctly from memory how to validate the answers above in terms of declarations by a particular Government; and

State correctly from memory, which sea area(s) are within own SRR.

#### 5.5 General equipment types

Aim: To develop an overview of the types of ships equipment and communication systems which make up the GMDSS.

**Objective:** By the end of the session the participant will be able to list from memory 9 systems of communication equipment which contribute to the GMDSS system.

## 5.6 Equipment requirements by sea area

Aim: To develop an understanding of the GMDSS requirements for ships equipment dependent upon sea area of navigation.

Objective: By the end of the session the participant will be able to:

Correctly list from memory all 8 types of communication equipment which must be carried by a ship navigating exclusively in GMDSS sea area A1;

Correctly list from memory all equipment, in addition to those for sea area A1, which must be carried by a ship navigating in sea area A2;

Correctly list from memory all equipment, in addition to those for sea areas A1 and A2, which must be carried by a ship navigating sea area A3; and

Correctly list from memory all equipment, in addition to those for sea areas A1, A2 and A3, which must be carried by a ship navigating sea area A4.

## **SECTION 6 - EPIRBS**

#### 6.1 General overview

Aims: To investigate all the EPIRB systems available to the mariner and to discuss which are acceptable under the GMDSS. The session will identify which of the beacons is considered acceptable equipment for each of the four GMDSS sea areas.

Objectives: By the end of the session the participant will be able to:

List correctly from memory all types of EPIRBs available to the mariner;

State correctly from memory which EPIRBs are acceptable to GMDSS regulations;

State correctly on every occasion which type of EPIRB is acceptable to any given sea area in the GMDSS system; and

Discuss accurately, with the aid of handouts where necessary, basic characteristics of the types of EPIRBs not acceptable to the GMDSS, and where each might be used.

## 6.2 The COSPAS-SARSAT system

Aims: To examine in details the COSPAS-SARSAT satellite system, revealing the more important characteristics and component parts.

Objectives: By the end of the session the participant will be able to:

Describe accurately with the aid of a handout, the origins of the COSPAS-SARSAT system, and be able to discuss those countries involved:

Describe accurately, with the aid of a handout, characteristics of both SARSAT and COSPAS satellites in the COSPAS-SARSAT LEOSAR system;

List correctly from memory ground elements which together make up the ground processing of COSPAS-SARSAT maritime distress alerting messages;

Discuss with the aid of a handout, the system of routing COSPAS-SARSAT distress alert messages on a global basis;

Discuss accurately with the aid of a handout the meaning of the Doppler effect and how it applies to the COSPAS-SARSAT system;

State correctly from memory, the location accuracy to be applied to both 406 MHz and 121.5 MHz beacon derived distress positions;

List correctly with the aid of a handout, two power and battery life characteristics of both 406 MHz and 121.5 MHz EPIRBs;

Accurately compare and contrast from memory the global and real-time modes of operation in the COSPAS-SARSAT system;

Discuss accurately from memory the meaning of the term "merged solution" in terms of COSPAS-SARSAT system distress alerts, and discuss how this affects information on a distress alert message:

Describe with the aid of a handout in very basic terms, the area of the earth where the real time mode of COSPAS-SARSAT operation cannot be achieved;

Demonstrate accurately on every occasion, analysis of COSPAS-SARSAT system distress alert messages; and

Describe accurately from memory the differences between GEOSAR and LEOSAR EPIRB systems.

## 6.3 Approved EPIRBs and EPIRB databases

Aims: To develop understanding of characteristics of EPIRBs used in the GMDSS system.

Objectives: By the end of the session participants will be able to:

With the aid of a handout, accurately describe the pertinent details of all EPIRB systems approved for use in the GMDSS;

Demonstrate knowledge about national EPIRB databases and 406 MHz beacon protocols; and

Understand the use of 121.5 MHz as a homing frequency.

#### **SECTION 7 - NAVTEX SERVICES**

## 7.1 General overview

Aims: To examine in detail the concept and role of the NAVTEX system within the GMDSS.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory, 2 main functions of the NAVTEX system;

State correctly from memory, the voice communication frequency associated with NAVTEX;

State correctly with the aid of a handout, the alternative frequency which will be made available for National (non English) language broadcasts after February 1999;

List correctly from memory, 6 out of 9 main system characteristics for NAVTEX as laid down in the GMDSS regulations; and

With reference to a handout, describe accurately the structure of the NAVTEX system.

## 7.2 Ship equipment and message priorities

**Aims:** To examine the role of ship NAVTEX equipment and identify it as receive only equipment, and to identify levels of priority for message handling in the NAVTEX service.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory, the capabilities of ship NAVTEX equipment in terms of transmission and reception; and

State correctly from memory, the 3 message priorities which can be assigned by NAVTEX CRScoast stations.

## 7.3 Message categories

Aim: To examine the various categories of message relevant to the NAVTEX system.

**Objectives:** By the end of the session the participant will be able to:

With reference to a handout, list correctly the 17 message categories of the NAVTEX system; and

State correctly from memory, the 3 message categories when cannot be deprogrammed from ship equipment and which message category should not be deprogrammed from ship equipment.

## 7.4 National NAVTEX system

**Aims:** To examine the National NAVTEX broadcast system in detail, and gain an understanding of how a broadcast can be achieved by this means.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory, which area of the WWNWS the national SRR falls into;

State correctly from memory, the nominal range of NAVTEX signals, and state correctly from memory, the likely maximum range of signals, and state correctly from memory, the designated range of the National NAVTEX broadcasts; and

List correctly from memory, the National NAVTEX broadcast remote aerial sites, and state correctly from memory, where the NAVTEX system is controlled from.

## **SECTION 8 - EPIRBS**

#### 8.1 General overview

**Aims:** To investigate all the EPIRB systems available to a mariner and to discuss which are acceptable under the GMDSS. The session will identify which of the beacons is considered acceptable equipment for each of the 4 GMDSS sea areas.

**Objectives:** By the end of the session the participant will be able to:

List correctly from memory, all types of EPIRBs available to a mariner;

State correctly from memory, which EPIRBs are acceptable to the GMDSS regulations;

State correctly on every occasion, which type of EPIRB is acceptable to any given sea area in the GMDSS system; and

Discuss accurately with the aid of handouts, where necessary, basic characteristics of the types of EPIRBs not acceptable to the GMDSS, and where each of them might be used.

## 8.2 The COSPAS-SARSAT system

**Aims:** To examine in details the COSPAS-SARSAT satellite system, revealing the more important characteristics and component parts.

**Objectives:** By the end of the session the participant will be able to:

Describe accurately with the aid of a handout, the origins of the COSPAS-SARSAT system, and be able to discuss those countries involved;

Describe accurately with the aid of a handout, characteristics of the different satellites used in the COSPAS-SARSAT system:

List correctly from memory, ground elements which together make up the ground processing of COSPAS-SARSAT maritime distress alerting messages;

Describe with the aid of a handout, the system of routing COSPAS-SARSAT distress alert messages on a global basis;

Describe accurately with the aid of a handout, the meaning of the Doppler effect and how it applies to the COSPAS-SARSAT system;

State correctly from memory, the location accuracy to be applied to 406 MHz beacon derived distress positions;

List correctly with the aid of a handout, power and battery life characteristics of 406 MHz EPIRB:

Accurately compare and contrast from memory, the global and real-time modes of operation in the COSPAS-SARSAT system;

Describe accurately from memory the meaning of the term "merged solution" in terms of COSPAS-SARSAT system distress alerts, and discuss how this affects information on a distress alert message:

Demonstrate accurately on every occasion, analysis of COSPAS-SARSAT system distress alert messages; and

Describe accurately from memory, the differences between MEOSAR, GEOSAR and LEOSAR EPIRB systems.

## 8.3 Approved EPIRBs and EPIRB databases

**Aims:** To develop understanding of characteristics of EPIRBs used in the GMDSS system.

**Objectives:** By the end of the session participants will be able to:

With the aid of a handout, accurately describe the pertinent details of all EPIRB systems approved for use in the GMDSS;

Demonstrate knowledge about national EPIRB databases and 406 MHz beacon protocols; and

Understand the use of 121.5 MHz as a homing frequency.

#### **SECTION 8 - SATCOMS**

#### 8.1 General overview

Aims: To investigate the background and characteristics of the Inmarsat system.

Objectives: By the end of the session the participant will be able to:

State correctly from memory how many satellites are involved in the Inmarsat system;

State correctly from memory the orbit characteristics of Inmarsat satellites and how they differ from those of the COSPAS-SARSAT system;

With the aid of a handout, discuss briefly but accurately the history of the Inmarsat system:

State correctly from memory what the acronym Inmarsat stands for;

List correctly from memory the four ocean areas for operations, and state correctly from memory which ocean areas are applicable to your SRR;

State correctly from memory what the nominal coverage of the Inmarsat system is, as designated under the GMDSS, and state correctly from memory the coverage which has been achieved in practice; and

With the aid of a handou,t list correctly the 4 radio frequencies utilised by the Inmarsat system, and with the aid of a handout, state correctly the purpose of each frequency.

#### 8.2 Component parts of the system

Aims: To examine the component parts of the Inmarsat data routing system, and the role played by each part.

Objectives: By the end of the session the participant will be able to:

List correctly from memory, the 4 contributing parts of the Inmarsat data routing system;

State correctly from memory the meaning of the acronyms; SES, MES, CES, LES, NOC and NCC;

Discuss accurately from memory the concept for provision of CES/LES throughout the world in terms of the operating authority;

State correctly from memory the location of Inmarsat Headquarters; and

Discuss accurately from memory the role of the NCC, and state accurately from memory the location of the associated LES.

#### 8.3 Variety of communications

Aims: To discuss the types of communication method and types of message which can be processed using the Inmarsat system.

Objectives: By the end of the session the participant will be able to:

List correctly from memory four types of communication method provided for by the system; and

List correctly from memory four categories of message which can be processed using the system.

## 8.4 System equipment

Aims: To examine the various standards of equipment available now and proposed for the future by Inmarsat Ltd. Such examination will categorize each system as GMDSS acceptable or not and which types of communications are achievable through each system.

Objectives: By the end of the session the participant will be able to:

List correctly from memory the 7 standards of equipment, including those currently in use and those planned for the future;

Distinguish correctly from memory between the two acronyms ADE and BDE;

List correctly from memory all 5 types of communications available through Inmarsat

— A:

List correctly from memory all 5 types of communications available through Inmarsat

— B:

List correctly from memory all 3 types of communications available through Inmarsat

— C:

List correctly with the aid of a handout, all the types of communications available through Inmarsat – E, M, F and Fleet 77;

Discuss accurately from memory why Standard – M is, so far, not acceptable equipment under the GMDSS; and

State correctly from memory how distress messages can be processed using Inmarsat – A, B and C.

## 8.5 Enhanced Group calling

Aims: To examine the purpose and usage of the Inmarsat Enhanced group calling system.

Objectives: By the end of the session the participant will be able to:

State correctly from memory the correct meaning of the acronym EGC;

Discuss accurately from memory the concept of the EGC system;

State correctly from memory the two sub systems which operate within the EGC system;

Discuss accurately from memory the purpose of both SafetyNET and FleetNET;

List correctly from memory all 5 types of message handled by the SafetyNET system:

List correctly from memory all 7 ways of addressing an EGC message; and

State correctly with reference to a handout where necessary the meaning of the term "information provider".

#### 8.6 Distress alert

Aims: To explore in depth the procedure laid down for operation of distress alerts received in the Inmarsat system.

Objectives: By the end of the session the participant will be able to:

Discuss accurately from memory when a Rescue Co-ordination Centre acknowledge a Distress alert from a vessel at sea under varying circumstances:

- Position is <u>within</u> own Search and Rescue Region (SRR);
- Position is <u>outside</u> own Search and Rescue Region (SRR);
- When <u>no position</u> information is given in the alert;

Discuss accurately from memory the subsequent action required of a RCC having acknowledged an Inmarsat distress alert;

State correctly from memory under which circumstances an Inmarsat distress alert would normally be relayed to another RCC:

Discuss accurately from memory the circumstances under which an Inmarsat distress relay alert would be transmitted by a RCC;

State correctly from memory which actions are required by a RCC receiving a distress relay alert from another shore station;

State accurately from memory which actions are required by a shore station receiving a distress acknowledgement from another shore station; and

State accurately from memory which actions are required by a RCC in receipt of an Inmarsat distress relay from another ship station.

#### 8.7 SafetyNET and SARNet broadcasts

Aims: To examine the procedures laid down to send broadcasts via SafetyNET and SARNet.

Objectives: By the end of the session the participant will be able to:

State correctly from memory all types of broadcast and areas to which a RCC or Coast Radio Station can broadcast to.

## 8.8 False alerts (re. Guidelines to Administrations on reporting false alerts)

Aims: To examine the procedures laid down on how to handle false Inmarsat alerts.

Objectives: By the end of the session the participant will be able to:

Discuss accurately procedures for RCCs on receipt of false alerts.

#### 8.9 Databases

Aims: To introduce the participant to the relevant databases used in the GMDSS.

Objectives: By the end of the session the participant will be able to:

List National and International databases relevant to the GMDSS.

#### **SECTION 9 - SART**

## 9.1 General overview

Aims: To examine the concept and purpose of the SART transponder, the frequency band of operations, the equipment required to detect SART signals and the nature of such signals as they appear on a radar screen.

Objectives: By the end of the session the participant will be able to:

State correctly from memory what the primary purpose of the SART is;

State correctly from memory what type of radar is required to detect SART signals;

State correctly from memory the recommended choice of radar range setting in order to detect SART signals;

Describe accurately from memory the radar image expected from a SART from first detection to that experienced when well within 1nm from the transponder; and

State correctly from memory how a survivor in the presence of an operating SART would know the transponder was being interrogated by approaching radar.

#### 9.2 Positioning aboard ship

Aims: To describe how many SARTs must be carried and where they may be located on board GMDSS ships.

Objectives: By the end of the session the participant will be able to:

State correctly from memory, how many SARTs must be carried by ships of less than 500grt, ships greater than 500grt, and passenger ships; and

State correctly from memory, where on board a ship the required complement of SART should be stowed.

## 9.3 Technical specification

Aims: To determine and understand the specifications of a SART as designated by GMDSS regulations.

Objectives: By the end of the session the participant will be able to:

State correctly from memory the frequency band designated for SART transmissions;

State correctly from memory the required minimum operating life of SART batteries, including standby and operating time; and

State correctly with the aid of a handout, the operating temperature range for a SART.

## 9.4 Range of SART signals

Aims: To explore the issue of detection range for SARTs both from theoretical specification and practical application.

Objectives: By the end of the session the participant will be able to:

State correctly from memory the IMO specified performance criteria relating to the range of detection of SART signals;

State correctly from memory the 2 examples of SART signal detection range as experienced by surface and airborne SAR units;

State correctly from memory any SAR facility has no capability to detect SARTs; and

Discuss accurately from memory, and with reference to 3 out of 5 guidelines factors which may affect the detection range of SART.

#### **SECTION 910 - EMERGENCY PORTABLE VHF RADIOS**

## 910.1 General requirements

**Aims:** To explore the requirements under the GMDSS for the carriage of emergency portable VHF radio units.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory, the number of such radios required foref ships of differenting sizes;

Describe Discuss accurately from memory, where the radios should be stowed on board ship;

State correctly from memory, what additional provision must be made if the radios are to be used in conjunction with the day to day business of the ship; and

StateDiscuss accurately from memory, the purpose of emergency portable VHF radios.

#### 910.2 Mandatory channels

**Aims:** To introduce the participants to the VHF channels which are mandatory under GMDSS legislation's and the purposes of each.

**Objectives:** By the end of the session the participant will be able to:

List correctly from memory, all 3 VHF radio channels mandatory under GMDSS legislation; and

StateDiscuss accurately from memory, the correct designation of VHF channels 16, 06 and 13.

#### SECTION 10 – Devices for locating

## 10.1 General overview

**Aims:** To examine the concept and purpose of the different devices for locating, the frequency band of operations, the equipment required to detect the different signals for locating and the nature of such signals.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory, what the primary purpose of the devices for locating is;

State correctly from memory, what type of equipment is required to detect the different signals for locating:

State correctly from memory the recommended choice of radar range setting in order to detect SART signals;

Describe accurately from memory, the radar image expected from a SART from first detection to that experienced when well within 1nm from the transponder; and

State correctly from memory, how a survivor in the presence of an operating SART would know the transponder was being interrogated by approaching radar.

## 10.2 Positioning aboard ship

**Aims:** To describe how many devices for locating must be carried and where they may be located on board GMDSS ships.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory, how many devices for locating must be carried by ships of less than 500grt, ships greater than 500grt, and passenger ships; and

State correctly from memory, where on board a ship the required complement of device for locating should be stowed.

## 10.3 Technical specification

**Aims:** To determine and understand the specifications of a device for locating as designated by GMDSS regulations.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory, the frequency band designated for SART and AIS-SART transmissions:

State correctly from memory, the required minimum operating life of SART and AIS-SART batteries, including standby and operating time; and

State correctly with the aid of a handout, the operating temperature range for a SART and AIS-SART.

## 10.4 Range of signals for locating

**Aims:** To explore the issue of detection range for different signal for locating both from theoretical specification and practical application.

**Objectives:** By the end of the session the participant will be able to:

State correctly from memory, the IMO specified performance criteria relating to the range of detection of different signal for locating;

State correctly from memory, the 2 examples of SART signal detection range as experienced by surface and airborne SAR units;

State correctly from memory, any SAR facility has no capability to detect SARTs; and

State accurately from memory, with reference to 3 out of 5 guidelines factors which may affect the detection range of SART.

Describe accurately the difference between SART and AIS-SART signals.

#### SECTION 11 - DIGITAL SELECTIVE CALLING

#### 11.1 General overview

Aims: To explore fully the characteristics and principles of the Digital Selective Calling (DSC) system.

Objectives: By the end of the session the participant will be able to:

List correctly from memory in which sea areas DSC is relevant;

Describe accurately with the aid of a handout, basic technical details of the DSC system, including the duration of a DSC alert on MF and VHF;

State accurately from memory the term used to describe the error check function of the DSC system and with the aid of a handout discuss how this works;

Describe accurately from memory, the number and frequency of distress alerts transmitted by ships' equipment:

State correctly from memory the options available when addressing a DSC message;

Discuss accurately from memory a potential difficulty in terms of range of communications when operating DSC equipment and the subsequent analogue RT equipment:

Discuss accurately from memory the meaning of the terms designated and undesignated DSC distress alerts;

Demonstrate from memory, correct analysis of a DSC distress alert message on 15 out of 18 occasions;

Discuss accurately from memory how position information can be derived for DSC systems, and the implications this may have for search area determination;

Accurately from memory distinguish, on every occasion, between MMSI numbers for ship stations, shore stations and groups of ship stations; and

State correctly from memory the 3 sources of information to enable the decoding of MMSI's.

## 11.2 DSC frequencies

Aims: To determine the frequencies in use with the VHF, HF and MF DSC system, and the procedure for subsequent RT communications.

Objectives: By the end of the session the participant will be able to:

List accurately from memory the frequency of MF DSC, the channel appropriate for VHF DSC, and in each case the associated RT frequency and channel; and

List accurately with the aid of a handout the 5 frequencies of HF DSC and in each case the associated RT frequencies.

#### 11.3 DSC coast stations

Aims: To examine the configuration of DSC coast stations in the national SRR.

Objectives: By the end of the session the participant will be able to:

List correctly from memory the Rescue Co-ordination Centres and Coast Radio Stations in the SRR which are provided with MF DSC.

## 11.4 DSC action by ship and coast stations

Aims: To explore in greatest possible depth the procedure laid down for operation of the DSC system.

Objectives: By the end of the session the participant will be able to:

Discuss accurately from memory when a Rescue Co-ordination Centre should acknowledge a Distress alert from a vessel at sea under varying circumstances:

- Position is in the Rescue Co-ordination Centres SRR:
- Position is outside the Rescue Co-ordination Centres SRR;
- 3. No position information is shown on alert;

Discuss accurately from memory the subsequent action required of a coast station having acknowledged a DSC distress alert;

State correctly from memory under what circumstances a DSC distress alert would be acknowledged by a ship station;

State correctly from memory under what circumstances a DSC distress relay would be transmitted by a ship station;

State correctly from memory under what circumstances a DSC distress relay would normally be transmitted by a coast station;

Discuss accurately from memory the circumstances under which a DSC distress relay would be transmitted by a coast station:

State correctly from memory what action is required by a coast station receiving a distress relay from another coast station;

State accurately from memory what action is required by a coast station receiving a distress acknowledgement from another coast station;

State accurately from memory what action is required by a coast station in receipt of a distress relay from a ship station; and

State correctly from memory under what circumstances a DSC acknowledgement is required from a coast station when dealing with urgency, safety and routine alerts.

#### 11.5 Overview of HF DSC

Aims: To ensure that participants are aware of the HF DSC system, the areas it applies to and which countries are directly involved.

Objectives: By the end of the session the participant will be able to:

Discuss accurately from memory the areas of the globe where HF radio can achieve propagation;

State correctly from memory how HF DSC and associated procedure compares to that of MF DSC:

State correctly from memory where HF DSC coast radio stations are situated; and

State correctly from memory the message routing procedure from HF DSC stations to the appropriate Rescue Co-ordination Centres for SAR action.

## SECTION 11 - Concept of RCC, CRS and CES operations

## 11.1 Equipment types

**Aim:** To introduce participants to the types of communication equipment operated by the RCC or CRS in which they operate.

Objective: By the end of the session participants will be able to correctly name from memory all types of RCC or CRS radio communication equipment used in operation rooms.

## 11.2 Workstations

**Aim:** To raise the awareness of participants as to the correct procedure of handing over a VHF channel 16 watch and associated equipment checks to make.

Objective: By the end of the session participants will be able to *list correctly from memory, all key considerations in terms of continuity of watch keeping and equipment checks for the operators attention when taking over the VHF channel 16 watch from a colleague.* 

## 11.3 Log keeping

**Aim:** To ensure all participants understand and are in a position to apply the correct log keeping procedure at radio watch keeping workstations.

Objective: By the end of the session the participant will be able to describe accurately from memory, all key considerations and log entries when maintaining a radio log.

#### 11.4 Publications

**Aim:** To raise the awareness of participants to written procedural support material held as standard issue at RCC.

**Objectives:** By the end of the session participants will be able to:

List correctly from memory, 5 publications held as standard issue at RCC; and

State accurately from memory, in which publication to find particular details relating to maritime communications on 7 out of 10 occasions.

## 11.5 Codes, signals and standard phrases

**Aim:** To ensure all participants understand and can practice international codes, signals and standard phrases.

**Objective:** By the end of the session the participant will be able to:

Use the International Code of Signals (ICS) as appropriate; Use spoken emergency signals and procedural words; and

Communicate in RT and in written message by using the IMO Standard Marine Communication Phrases (SMCP).

## 11.6 Communications for SAR operations

**Aim:** To ensure all participants can select SAR-dedicated frequencies and communicate with all SAR components of a SAR operation.

**Objective:** By the end of the session the participant will be able to:

Select SAR-dedicated frequencies;

Format distress and safety messages;

Communicate with all participants of a SAR operation;

Draft SAR operation messages including situation report (SITREP), search action messages, rescue action messages and other SAR messages;

Understand distress alert information from CRS, CES and MCC; and

Relay distress alert information to others RCC and communicate with them.

## 11.7 Authority and responsibility for national RCC, CRS and CES communications

**Aim:** To ensure participants understand levels of authority and responsibility involved in operating RCC and CRS communication equipment and the responsibility for local training and development.

**Objectives:** By the end of the session participants will be able to:

State accurately from memory, by whose authority RCC, CRS and CES communication equipment is operated;

State accurately and from memory, who is responsible for correct operation and use of RCC, CRS and CES communication equipment; and

State accurately and from memory, who is responsible for ensuring the provision of adequate training for individuals in the operation and use of RCC, CRS and CES communication equipment.

# 11.8 Advice to the Public on efficient radio procedure and use of radio communication equipment

**Aims:** To raise awareness amongst participants as to National RCC, CRS or CES policy on giving advice to members of the public regarding the installation and operation of communication equipment.

**Objectives:** By the end of the session participants will be able to:

State correctly from memory, where to find details of official advice as to GMDSS equipment carriage recommendations for pleasure craft;

State correctly from memory, where to find details of official advice as to GMDSS equipment carriage regulations and recommendations for fishing vessels;

List accurately from memory, the radiocommunication carriage requirements for all vessels; and

List accurately from memory, 5 reasons why mobile telephone equipment is not the preferred choice for communications equipment at sea.

## 11.9 Equipment user manuals & guides

**Aims:** To remind participants of the importance of maintaining user manuals and guides in good condition and their shared availability between all members of operations room staff.

**Objectives:** By the end of the session the participant will be able to:

Identify accurately with the aid of student notes, all user manuals available to support equipment currently installed at RCC; and

State from memory, where these manuals are located, or make a verbal report as to how he/she would arrange for these manuals to be stored and made available to all staff.

#### 11.10 Equipment power delivery

**Aims:** To raise the awareness of participants of his/her stations provisions for backup power supplies and standby batteries.

**Objectives:** By the end of the session the participant will be able to:

Describe accurately with the aid of study notes, the provision for Uninterruptible Power Supply (UPS) and standby generator or battery power at his/her site.

#### SECTION 12 - IMPLICATIONS OF THE GMDSS FOR RCC'S

## 12.1 Distress alert

**Aims:** To explore in depth the procedure laid down for operation of distress alerts received in the different radiocommunication systems.

**Objectives:** By the end of the session the participant will be able to:

State accurately from memory, when an RCC acknowledges a Distress alert from a vessel at sea under varying circumstances:

- 1. Position is within own SRR;
- 2. Position is outside own SRR; and
- When no position information is given in the alert;

Elaborate accurately from memory, the subsequent action required of an RCC having acknowledged an alert [with the different radiocommunication systems];

State correctly from memory, under which circumstances an alert [with the different radiocommunication systems] would normally be relayed to another RCC;

Elaborate accurately from memory, the circumstances under which distress relay alert would be transmitted by an RCC, and explain by what means this distress alert relay can be performed;

State correctly from memory, which actions are required by an RCC receiving a distress relay alert from another shore station;

State accurately from memory, which actions are required by a shore station receiving a distress acknowledgement from another shore station; and

State accurately from memory which actions are required by an RCC in receipt of a distress relay from another ship station.

#### 12.2 False alerts

Aims: To examine the procedures laid down on how to handle false alerts.

**Objectives:** By the end of the session, the participant will be able to:

Describe accurately procedures for RCCs on receipt of false alerts.

## 12.3 Interference problems

**Aims:** To manage radiocommunications in case of interference.

**Objective:** By the end of the session, the participant will be able to:

Use reserve frequencies in case of interference; and Use the appropriate commands to make silence on the frequency.

## 12.44 Information gathering

**Aims:** To revisit the subject of information gathering, and examine the implications of the GMDSS and other radio equipment in this area.

**Objective:** By the end of the session the participant will be able to:

List accurately from memory, all [9] of the means available under GMDSS legislation and previous legislation by which RCCescue Co-ordination Centres can achieve broadcast action;

Discuss—Describe accurately, and from memory, in terms of target audience, the frequencies and/or channels available for broadcast action;

<del>Discuss</del> Describe accurately, and from memory, in terms of target area, the choice of communications medium for broadcast action;

List correctly from memory, the [4] potential means of holding reasonably secure telephone communications with the Master of a ship;

Describe Discuss accurately, with the aid of a handout, the concept of any radio link system calls through CRS facilities;

State correctly from memory, on which of the different Recognized mobile satellite services Inmarsat systems, telephone connection is available;

State correctly from memory, on which of the different Recognized mobile satellite services Inmarsat systems, telex connection is available;

List accurately from memory, all [3] methods of achieving a telephone call to a ship by Recognized mobile satellite service<del>Inmarsat</del>; and

<del>Discuss</del> Describe accurately from memory, the procedure which should be followed to achieve a NAVTEX broadcast in the SRR.

## 12.52 Search planning

**Aims:** To examine the implications of GMDSS equipment for day to day decision making in search planning problems.

**Objectives:** By the end of the session the participant will be able to:

Discuss accurately from memory the target populations for marketing of 121.5 MHz ELT's/PLB's, and state correctly from memory what assistance this may be to an SMC during search planning;

Describe accurately the remaining possibility nowadays to receive a distress alert by 121.5 MHz ELT's/PLB's, and state correctly from memory what implication this may be to an SMC during search planning;

DescribeDiscuss accurately from memory, reasons why no survivors may be in the vicinity of an EPIRB located at sea;

Describe Discuss accurately from memory, difficulties which may hinder the deployment of SARTs or AIS-SART by survivors, and why location of the SART or AIS-SART will not always succeed in locating all survivors:

Describe the different types of EPIRBs in use and purchase on the market;

Describe Discuss accurately from memory, the time delay which may be experienced between the fixing of a Doppler position and receipt of the COSPAS-SARSAT alert message at an RCCescue Co-ordination Centre, and state correctly what implication this may have for a valid search plan;

Describe Discussion accurately from memory, the implications for initial position error to a position derived from Recognized mobile satellite service Inmarsational and

State correctly from memory what guidelines, in terms of time, would be considered when terminating a search for EPIRBs, and SARTs, AIS-SARTs or any other devices for locating.

#### 12.63 Effort allocation

**Aims:** To examine the implications of GMDSS equipment on day to day decision making in terms of effort allocation to a search.

**Objectives:** By the end of the session the participant will be able to:

StateDiscuss accurately with the aid of a handout, the nominal range of VHF radio signals in all 6 situations with regard to craft type and antenna height; and

State correctly from memory, the implications for track spacing during a search for EPIRBs with a 121.5 MHz homer, or a SART, AIS-SART or any other devices for locating and a target known to have a portable handheld VHF radio.

#### 12.74 Search instructions

**Aims:** To revise the concept of complete and unambiguous search instructions and how requirements for contents might change as a result of GMDSS equipment.

Objectives: By the end of the session the participant will be able to discussitate accurately from memory, the need to furnish complete and specific instructions in terms of equipment such as SART, AIS-SART and Portable VHF radio or any other devices for locating.

## 12.85 Probability of detection (PoD)

**Aims:** To examine the potential effect of GMDSS equipment on choice of track spacing compared with choices relevant to more traditional search targets.

**Objectives:** By the end of the session the participant will be able to discussdescribe accurately from memory, the implications for PoD when searching an area for targets such as VHF Radio, 121.5 MHz homer, and SARTs, AIS-SART or any other devices for locating.

## 12.96 Decoding MMSI's, serial numbers & alert messages, and databases

**Aims:** To ensure participants have a comprehensive understanding of all identification numbers and message formats relevant to the GMDSS system and, know how to decode them and which publications and databases are available.

**Objectives:** By the end of the session the participant will be able to:

Demonstrate from memory, correct analysis of distress alert messages related to EPIRBs406 MHz and 121.5 MHz beacons:

Demonstrate decoding of an MMSI number;

Discuss accurately from memory, the usage of Serial identification numbers, MMSI and call sign identification for EPIRBs;

State correctly from memory, what is meant by the term SPOC and where you would find related contact information; and

State correctly from memory the format of IMN's in the Inmarsat - A, B, C, E, F and M standards.

List National and International databases relevant to the GMDSS.

# SECTION 13 - practical use of RCC<del>rescue co-ordination centre</del>, and CRS and CES<del>coast radio station</del> communication equipment

#### 13.1 Communication equipment

**Aims:** To ensure participants are familiar with all items of communication equipment and understand all the user functions and fault recognition with each.

**Objectives:** By the end of the session the participants will be able to:

Demonstrate accurately from memory, adequate knowledge about, and how to operate all types of communication equipment at own RCC or CRSeast Radio Station;

Describe accurately from memory, the correct basic fault reporting procedure for radio equipment, and state accurately from memory to whom the signals are forwarded; and

State correctly from memory, where to find the correct format for radio fault reporting and the designation of fault priorities.

## 13.2 Other types of SATCOMS message broadcast

**Aims:** To examine the procedures laid down to send broadcasts via other types of recognized mobile satellite services message broadcast.

**Objectives:** By the end of the session the participant will be able to

state correctly from memory all types of broadcast and areas to which an RCC or CES can broadcast to on recognized mobile satellite services.

## 13.3 Testing and maintenance of GMDSS equipment

Aims: To examine the procedures to test and maintain GMDSS equipment

**Objectives:** By the end of the session the participant will be able to:

Test the different GMDSS equipment of the RCC, CRS and CES; and Identify the main issues of maintenance of the GMDSS equipment in use.

SECTION 14 - Telephone, fax and RT calls to ships

## 14.1 Methods of making calls

**Aims:** To increase the awareness of participants to the various means of placing calls, by telephone, and fax, telex and any other format message from operation rooms to ships, and to offer information on the appropriate charge bands for such calls.

**Objectives:** By the end of the session the participant will be able to:

Describe<del>Discuss</del> accurately how to place a telephone, fax, and telex and any other format message call directly from the operation room to a ship station by the recognized mobile satellite services Inmarsat system.

Describe Discuss accurately from notes, the concept Integrated Command and Control System (ICCS) conference call, and list correctly from memory, the details which will be required when attempting to place calls by such means;

List<del>Discuss</del> accurately from memory, the advantages and disadvantages of using mobile cellular telephones for communications with vessels; and

Describe Discuss accurately from memory the potential usage of such telephone, telex, and fax and any other format message calls from RCCescue Co-ordination Centre operation rooms to ships.

## 14.2 Methods of charging calls

Aims: To increase the awareness of participants to the different means of charging calls, by telephone, fax, telex and any other format message from shore to ships.

Objectives: By the end of the session the participant will be able to

understand the method to charge telephone, fax and any other format message calls to ships.
